CAN WE MAKE ENOUGH?

The Association of Consulting Chemists and Chemical Engineers {ACC&CE} invites you to a presentation by Marvin B. DeTar Ph.D.

“Can we make enough” describes the steps a consultant should make to improve the productivity of a reaction for a concerned client.

Dr. Marvin DeTar is a chemical process technology management consultant, patent application producer, forensics and expert witness consultant. Molecular Technologies, Ltd is a technology management consulting company incorporated in 1999. Major successes have been made in improving process yields, in producing patents within client teams and in both synthesis and analysis work in organic and inorganic chemistries.

- An improved preparative method for the production of a livestock additive was invented. The patent application issued (2021).
- Polymer insulation for the team that invented magnet wire used in electric cars was contributed. This new motor winding wire (1,000 volt inverter duty, 10,000 volt dielectric) is the major wire used in electric vehicles worldwide today. US Patents issued 2017 and 2019.
- Pro bono work for a charity provided a process to make a natural polymer for use in rural Columbia and to provide local jobs. (2016)
- Over thirty percent of one company's customer complaints were eliminated using microscopy. (2013)
- A water-based paint remover that eliminated NMP, DMF and methylene chloride was patented. (2005)
- Two missing steroid metabolites were synthesized for the FDA. (2002)
- Many clients were helped by process improvements, failure analyses and project management. (1999-2023)

#

ACC&CE was founded in 1928 by a group of distinguished chemists who felt an acute need for an association that would advance the practice of consulting chemists and chemical engineers, and which would include consultants who would conform to the highest principles of professional conduct. We continue to this day as the only organization of its kind and constantly attracts qualified technical consultants of all kinds who assist their clients in creating and using chemical and engineering knowledge and technology.

Members of the Association are qualified chemists, chemical engineers, or other technical specialists presently engaged in consulting practice in fields closely allied to chemistry and chemical technology, and for whom consulting is their principal income-earning activity. Application to membership is open to anyone.

Applications are reviewed by a governing Council, which considers the applicant's background, credentials, and references and then votes on admission to membership. Council may revoke membership when the Association's high standards are not maintained.

Membership in the Association brings benefits beyond referrals of client inquiries. New members, or members challenged by a new kind of assignment, receive help and guidance from fellow members acting as colleagues. Periodic virtual meetings bring members together and offer additional opportunities for members and guests to learn from and advise one another. From time to time the Association organizes seminars and workshops of interest to the membership and guests.
